

WAHKONSA ANNEX BUILDING

COMMUNITY ENGAGEMENT, CLEANUP, REVITALIZATION

BACKGROUND

The City of Fort Dodge is located in north central Iowa at the crossroads of US Highways 20 and 169. Nearly 1,500 citizens reside downtown, and several thousand more workers commute into downtown on a daily basis, making redevelopment of the city center a high priority.

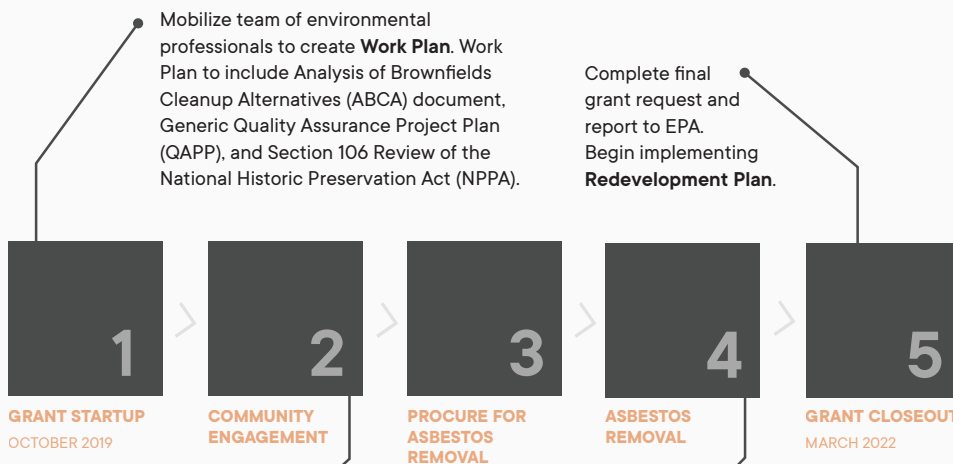

Situated in the center of downtown is the abandoned Wahkonsa Annex Building. The construction of this seven-story 134,000 square foot structure began in 1917 in order to expand the original Warden Plaza as the demand for lodging for business travelers and vacationers increased. It is part of what was once one of the largest hotel complexes west of the Mississippi River.

However, population decline and disinvestment in the mid-1970's left many multi-story buildings, including the Wahkonsa Annex, in the City's downtown, vacant and eventually abandoned.

The City acquired the Annex in 2016 with the intention of redeveloping the site, either through demolition or by remediating known asbestos contaminants before renovation. Through an extensive public input process it was determined that full abatement of asbestos containing material was preferred. The redevelopment plan aims to bring new life and purpose to the once thriving facility.

The Wahkonsa Annex is the latest property in the City's Brownfields Redevelopment Program, which has been in existence since 2000. The program has successfully assessed dozens of dilapidated, contaminated, or vacant properties and has spurred significant public and private investment in the downtown area.

PROJECT SUCCESS TIMELINE

Stakeholders and the general public provided valuable input to the cleanup of the Wahkonsa Annex Building at several open houses in 2020. A dedicated website was also created for the project: fortdodgebrownfields.com

Over 50 building materials tested positive for asbestos. These included, but are not limited to: flooring, mastics, ceiling texture, pipe insulation, and roofing components. Asbestos Containing Materials (ACMs) were found on every level of the 134,000 square foot complex. REW Services successfully removed all ACMs specified in the Project Manual from the Wahkonsa Annex in the Winter of 2021/2022.
